This antisense oligonucleotide is specifically hybridisable with selected DNA or RNA deriving from the puromycin-sensitive aminopeptidase (PSA) -99. This oligonucleotide is used for dignosing conditions associated with PSA expression. The human PSA-99 (875 amino acids) and the murine PSA-99 (920 amino acids) both exhibit PSA activity and can be used to generate anti-PSA antibodies. Cell lines which produce the antibody and host cells transfected with vector containing nucleic acid molecules encoding the PSA and the oligonucleotides can be used in assays for identification of agents which act by targeting PSA, for modulating PSA activity or endogenous PSA substrates, proliferation rate or viability of cells or to induce apoptosis within cells by inhibiting PSA activity. Agents which can diminish PSA activity in cells, by modulation of the amount of PSA in cells due to modulation of PSA ymphesis, may be used in treatment of proliferative diseases, including tumours such as leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Isolated protein with puromycin-sensitive aminopeptidase activity - which may be used in treatment of proliferative disorders, including cancer and

RESULT 1291 AAV85579/c

```
The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). AAV8555 to AAV8556 represent PCR primer used for obtaining LRP5 colba. Nucleic acid molecules (NAMs) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMs or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomerulonephritis, diseases and disorders involving disruption of endocytosis and/or antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              presentation, cytokine clearance and/or inflammation, viral infection, pathoganic bacterial toxin contamination, elevation of free fatty acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's disease and cardiovascular disease. Products from the present invention

This sequence is a probe used to test the method of the invention. The method is for the detection of a hybrid of a target nucleic acid and a probe nucleic acid in a sample comprises: (1) preparation of a labelled cunit composed of late and labelled substances capable of interactive action in a phenomenon of electron flow in double helix structure in the presence of a hybrid via a linker; (2) addition of a probe nucleic acid having a complementary base sequence to the base sequence of target nucleic acid (3) placing the sample under conditions capable of forming the target nucleic acid and the probe nucleic acid to give a hybrid; (4) mixing the sample capable of forming the hybrid and the labelled unit; (5) detection of the change in the lat and/or labelled substances caused by their interaction; and (6) detection of the presence of the hybrid in the sample. The method can be used for the detection of a target nucleic acid having a specified base sequence. The method allows for the simple and easily operable detection of labelled nucleic acids for respective base sequence
                                                                                 Detection of a target nucleic acid - using a labelled unit with labels capable of interactive action in a phenomenon of electron flow in double helix structure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Spheroidin, Entomopoxvirus, expression system, replication, heterologous gene expression; thymidine kinase, poxvirus, vaccinia, swinepox virus, insect pest control; immunity, PCR primer, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is a primer for the Amsacta moorei entomopoxvirus (AmEPV) spheroidin gene. The amplified sequence is an example of the gene of the invention, which encodes a 115 kDa protein. EPV spheroidin and thymidine kinase promoters can be used in DNA constructs and vectors for expression of heterologous genes in insects or mammalian cells, e.g. vectors containing Bacillus thuringiensis toxin genes for use in insect control, or recombinant vaccinia or swinepox viruses for use as viral vaccines. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                            virus. The expression vectors can also be used for the control of pests through the insertion of a gene encoding an insect toxin into the expression vector which will infect the target pest and produce large quantities of the toxin. Spheroidin and thymidine kinase are nonessential proteins which makes them ideal for the insertion of exogenous DNA and they are capable of operating in a vertebrate poxvirus (e.g. vaccinia)-mammalian cell-mediated and humoral immunity. (Updated on 20-MAR-2003 to correct PR field.)
                                                                                                                                        PCR primers AA210086-87 were used to amplify Amsacta moorei entomopoxvirus gene sequences. These DNA sequences are used to make expression systems of the invention. The specification describes an Entomopoxvirus (BPV) expression system that is capable of directing the replication and expression of a heterologous gene in a selected host cell. The expression of a heterologous gene in a selected host linked to the selected heterologous gene sequence. The expression system is used for the expression of heterologous sequences and the production of selected proteins in insect and mammalian host cells e.g. human, rodent and primate cells. BPV thymidine kinase and spheroidin genes can also be used in vertebrate poxviruses such as vaccinia and swinepox
                                                   expression system for the expression of heterologous sequences in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human mdm2 gene; proliferation; tumour; phosphorothioate; p53; cancer; antisense; modulation; oligonucleotide; expression; inhibition; hyperproliferation; blood cancer; brain cancer; breast cancer; lung cancer; soft tissue cancer; psoriasis; fibrosis; atheroselerosis;

                                                                                     AAZ3741, AAZ3742, AAZ37739, AAZ37741 and AAZ37741 the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated with mdm2, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAZ37473-Z37738 represent human mdm2 phosphorothioate oligonucleotides. AAZ37471, AAZ37739, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense compounds used to treat eg. hyperproliferative conditions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a PCR primer used to isolate DNA encoding the human fatty acid desaturase, FADS-2, of the invention. An antibody directed against the 3 FADS molecule of the invention (FADS-1, FADS-2, and FADS-3) is useful for diagnostic or therapeutic purposes. The FADS coding sequences are useful in gene therapy. The polypeptide and antibodies are useful in screening for modulating drugs. The polypeptides are also useful for treating liver disease, coronary artery disease and cancer. Note: Two copies of the sequence listing are present within this patent, which contain different sequences. AAA90952 and AAA80955 are both as being SEQ ID's 7-22.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel cDNA molecules encoding three human fatty acid desaturases, FADS1, FADS2 and FADS3, useful in the treatment of liver disease, coronary artery disease and cancer.
treat an animal having a disease or condition associated with mdm2, particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis
                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, fatty acid desaturase, FADS-1, FADS-2; FADS-3; gene therapy; liver disease, coronary artery disease, cancer, PCR primer; ss.

mentoring treatment in a patient by amplifying nucleic acid targets monitoring treatment in a patient by amplifying nucleic acid targets (NT) if present in obtained patient's biological sample, and detecting the presence of NT which is indicative of the presence of metastatic melanoma and breast cancer cells. Also described is a kit useful for detecting melanoma and breast cancer cells comprising a pair of primers for amplifying NT from a set of breast cancer marker genes which includes C Met, GalNAc, MAGE-3, CKZO, betaHCG and MAGE-1 or a set of melanoma marker genes including tyrosinase, MART-1 and MAGE-3 and containers for each pair of primers. The method is useful for detecting metastatic melanoma cells and breast cancer cells, subclinical metastasis and for monitoring treatment in the patient's biological sample such as blood, tumour draining lymph node, bone marrow and cerebrospinal fluid. The method is sensitive, specific and detects occult melanoma or breast cancer cells in the blood of patients with or without clinical evidence of the disease.

The present sequence represents a PCR primer for C-Met, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Gaarde W;

configuration and the mush with the configuration of antibution of antibution. The antisense oligonucleotides were designed to target confiderent regions of the human MEKKS RNA, and were analysed for their effect on MEKKS mRNA levels by district real-time PCR. MEKKS (also known as mitogen-activated protein kinase kinase 5, MEK kinase kinase 5, MEK kinase kinase 6, apoptosis signal-regulating kinase 1, and ASKI) is a dual-specific serine/threonine kinase which mediates cellular responses to mitogenic stimuli by activating both the JUK/SAPK (Jun Northamson) kinase/stress-activated protein kinase) and p38 modules of MAP kinase cascades. MEKKS is thought to play a critical role in the cregulation of apoptosis (programmed cell death) by interacting with other proteins in this cascade and by phosphorylating downstream targets such as MKKS and SERI. MEKKS also participates in another apoptosis-related signalling cascade involving the modulation of transcription factors. Activation and dimerisation of MEKKS is induced by tumour necrosis factor species. Thioredoxin is able to associate with MEKKS and inhibit mEKKS kinase activity and hence MEKKS-dependent apoptosis. The oligonucleotides confitting activity and hence MEKKS-dependent apoptosis. The oligonucleotides confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and traetment of confitting are useful for diagnosis, prevention and anterest and confitting are useful for diagnosis, prevention and confitting are useful for diagnosis, prevention and confitting are useful for diagnosis, prevention and confitting are useful for diagnosis. ions associated with MEKK5 expression, such as inflammation and Sequences AAA61956-A61995 represent phosphorothioate antisense Sequence 20 BP; 2 A; 5 C; 9 G; 4 T; 0 U; 0 Other; wound healing disorders

The invention relates to the determination of the concentration of a nucleic acid target, using a fluorescently labeled probe which produces reduced fluorescence emission when hybridised to the target nucleic acid. The method comprises measuring the reduction in emission caused by hybridisation. The new method is particularly used to quantify target nucleic acids by a real-time polymerase chain reaction, e.g. for quantifying microbial cells in co-cultures or symbiotic systems, for detecting gene mutations or polymorphisms, and for analysing melting curves of target nucleic acids to be quantified quickly, easily and accurately. Particularly there is no need to remove unbound probe, and no materials are introduced that inhibit amplification by Tag polymerase (so materials are introduced that inhibit amplification by Tag polymerase (so conventional PCR conditions can be used). The specificity of PCR is kept high (amplification of primer dimers is delayed), and the limit of quantitation is reduced. Complex probes are not needed, and amplification can be monitored in real time. The working graph for data analysis (automatically generated by a computer) has a higher correlation confidenced and graphs so more accurate quantitation is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining the concentration of a target nucleic acid, useful e.g. for detecting genetic mutations, comprises using a fluorescently labeled probe in which emission is reduced by binding to the target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  possible. The current sequence refresents a nucleic acid probe of the invention that was used for investigating the effects or the numbers of G(s) in each target nucleic acid, and the number of G(s) in its
                                                                                                                                                                                                                                                                                                                                                                                                                Kamagata Y, Kurata S, Yamada K, Yokomaku T;

This invention relates to antisense compounds 8-30 nucleobases in length transfer to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslational start site, translational termination region or 3'-untranslated region of a nucleic acid encoding a p38 mitogen activated protein Kinase (MAPK), where the antisense oligonuclectides inhibit the expression of MAPK. Sequences AAC79501 represent human p38alpha MAPK and p38beta MAPK cDNA sequences. AAC79501 represent human p38beta MAPK and p38beta MAPK cDNA AAC79501 and AAC79501 and AAC79501 and AAC79501 and AAC79501 and AAC79501 and AAC7951 included in the invention are a p38alpha cDNA sequence AAC79523 and antisense oligonuclectides AAC79523 - AAC79535 isolated from rat tissue. Murine p38beta MAPK cDNA is represented in AAC79537 and antisense oligonuclectides regreting the sequence are given in AAC79538 - AAC79522. The antisense oligonuclectides have antishematic; antistributaticic; antistributaticic; antistributaticic; antistributaticic; antistributaticic; antistributaticic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunosuppressive; cardiant and antiinflammatory activity. The antisense oligonuclectides are useful for inhibiting the expression of p38 MAPK in cells or tissues. The oligonuclectides are used for treating an animal with diseases such as inflammatory or autoimmune diseases e.g. rheumatoid arthritis, or heart disease. The oligonuclectides are also useful for
                                                     Antisense oligonucleotide; p38 mitogen activated protein kinase; MAPK; antirheumatic; antiarthritic; immunosuppressive; cardiant; heart disease; antiinflammatory; autoimmune disease; rheumatoid arthritis; apoptosis; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense compound targeted to p38 mitogen activated protein kinase inhibits protein kinase and is useful for diagnosing and treating
                                                                                                                                                                                                                                                                                                                                                                                                                                               Mckay R, Popoff I;

```
The present invention specifically claims AAH56368 to AAH56832 which are antisense oligonucleotides to nucleotide sequences encoding groE. More generally, antisense compounds (I) comprising antisense oligonucleotides of 5-50 bases targeted to a nucleotide sequence encoding groE. More of 5-50 bases targeted to a nucleotide sequence encoding groE. (heat shock protein (HSP)60) (GL) and groES (HSP10) (GS) gene from a microorganism, where the antisense compound is complementary to GL or GS is claimed. (I) have antibacterial, antiviral and expression of GL or GS, is claimed. (I) have antibacterial, antiviral and for inhibiting expression of GL or GS in cells or tissues in vitro. (I) are also useful for inhibiting the growth of a microorganism, or inhibiting the growth of a microorganism, or inhibiting the growth of a microorganism, or inhibiting the growth of a microorganism or to a cell infected with the microorganism, (I). (I) are also useful for treating a mammalian pathological condition mediated by the microorganisms which involves administering to the microorganisms which involves administering to the microorganisms which involves administering to the correct and administering (I) is such that the growth of microorganism is inhibited. The antisense compounds are utilised for diagnostics, to prophylaxis and as research reagents and kitts, e.g., to prevent or delay microbial infections in humans. They are also useful as molecular weight markers. AAH56362 to AAH56857 and AAH56854 represent PCR primers for grow grows encourage the present invention. AAH56855 and AAH56870 represent

```
antisense targets. The method involves preparing an antisense oligonucleotide capable of inhibiting mRNA expression of target mRNA sequences; as well as antisense oligonucleotides capable of binding DNA. The antisense and antisense oligonucleotides capable of binding DNA agents for the treatment of genetic disease. The present DNA sequence is human carbonic anhydrase (CAL2) protein target DNA related to the invention. Note: The present sequence is shown as DNA in the specification; however, in vivo, this target sequence would be mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                õ
                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                     The present invention relates to an antisense compound 8-30 nucleobases in length targeted to nucleobases 1-308 of the 5' untranalated region, 1776-1806 of the translation termination codon region or 1818-2370 of the 3' untranslated region of a nucleic acid molecule encoding human mdm-2. The invention is useful for reducing hyperproliferation of human cells, modulating the expression of mdm2 in human cells or tissues or in vitro. The hyperproliferative disorder includes cancer or psoriasis

The antisense compounds are useful for inhibiting the expression of PEPCK-cytosolic in cells or tissues. They are commonly used as research reagents and in diagnostics, e.g. to elucidate the function of particular genes. They are also useful for distinguishing between functions of various members of a biological pathway and for research use. The antisense compounds are also useful prophylactically, e.g. to prevent or delay infection, inflammation or tumour formation. The present sequence is a chimeric phosphorothioate oligonucleotide with 2'-MOE wings and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention describes polynucleotides comprising single nucleotide polymorphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polynucleotides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and cativity and are involved in disorders such as schizophrenia, Parkinson's and mycolonus (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is a divantageous to detect polymorphisms in the DRD2 gene and how those polymorphisms are combined in different copies of the gene. AAF70261 to AAF70309 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 to AAF70452 represent oligonucleotide primers for the detection of the present DRD2 polymorphisms which are given in the exemplification of the present invention. AAF70453 to AAF70453 trepresent equiven in the present invention of the human DRD2 convention.

```
codon region, state to the 5' untranslated region, translation termination condon region, state of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense objection start the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. The antisense objection of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tumours, colorectal carcinoma and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound calcuse hyperproliferation of human cells. The method, which involves the use of the antisense compound; is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and physiological processes and useful in both clinical research and chiganostic tools AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to antisense compounds, 8-30 nucleobases in

                                                                            ò
                                                                                                         셤
                                                                                                                                                                                                                                    The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, coding region or translation start site of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense oligonucleotides of the invention are useful for encoding human mdm2 and for inhibiting the expression of mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2 e.g. a hyperproliferative disorder such as cancer (blood, brain, breast, lung, or a soft tissue cancer) and chronic myelogenous leukemia. The antisense compound may be and chronic myelogenous leukemia. The antisense compound may be administered with a chemotherapeutic agent to overcome drug resistance. The antisense compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and adjagnostic tools. AAS29242-AAS29507 represent the human mdm2 antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            An antisense compound, useful for treating e.g. cancer, comprises nucleobases targeted a region (e.g. translation termination codon region) of a nucleic acid encoding human mdm2.
                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER /note= "OTHER= All phosphorothioate linkages, additionally bases 1-6 and bases 15-20 are 2'-0-methoxyethyl bases, and bases 7-14 are deoxynucleotides"
                                                                                                                                                                                                             Human; mdm2; hyperproliferative disorder; cancer; psoriasis; atherosclerosis; tumour; cytostatic; anti psoriatic; anti arteriosclerotic; vasotropic; antisense; phosphorothioate; ss.

                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                          ö
                                                                       The invention relates to an antisense oligonucleotide targetted to a nucleic acid molecule encoding human epidermal growth factor receptor (Herl) to inhibit its expression. The antisense compounds are useful for treating diseases or conditions associated with Her-1 such as hyperproliferative diseases especially cancer (lung, ovarian, colon or prostrate cancer) and psoriasis. They are also useful as research reagents, diagnostics, therapeutics, kits and prophylactically e.g. to prevent or delay tumour formation. The present sequence is an antisense oligonucleotide targetted to human Her-1
                 Novel antisense oligonucleotide that specifically hybridizes with and inhibits nucleic acid encoding epidermal growth factor receptor, useful for treating hyperproliferative disease such as cancer or psoriasis.
                                                                                                                                                                                                          Gaps

Antisense compounds targeted to nucleic acids encoding RECQL2 associated with Bloom's disorder, for modulating RECQL2 expression and treating diseases e.g. tumors associated with expression of the RECQL2 in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to antisense compounds targetted to nucleic acid encoding RECQL2 (gene associated with Bloom's disorder) to inhibit the expression of RECQL2. Antisense compounds of the invention are useful for treating diseases associated with expression of RECQL2, in humans. They are useful for diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human RECQL2 DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse, primer; antilipaemic; cardiant; hypotensive, anorectic; HYPLIP1; FCHL1; lipid disorder; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; cancer; hyperapobetalipoproteinaemia; hypertridlyceridaemia; obesity; ss; familial dyslipidaemic hypertension; syndrome X; insulin resistance;

This invention relates to the cDNA and protein sequences of novel proteins HYPLIP1 or FCHL1 and to sequence variations within these genes that have been shown to be associated with lipid disorders.

Coligonucleotide probes that hybridise to the cDNA sequence are useful for Oligonucleotide probes that hybridise to the cDNA sequence are useful for analysing the expression of FCHL1 by detecting the expression of the mRNA transcript in the sample. A host cell transformed with the cDNA of the invention is useful for producing the protein by recombinant means.

Consecution is useful for preventing a lipid disorder associated with expression of FCHL1 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype,

Typerapobetalipoproteinaemia, hypertriglyceridaemia, familial dyalipidaemic hypertension, syndrome X, obesity, insulin resistance and hypercholesterolaemia. The cDNA sequence is useful in the diagnosis or prognosis of predisposition to lipid disorders and cancers, and also to identify a molecule which enhances or decreases the HYPLIP1 or FCHL1 activity. The present sequence represents an oligonucleotide primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   specific for the mouse HYPLIP1 locus of the invention. The mouse HYPLIP1
                                               Novel HYPLIP1 and FCHL1 genes and their sequence variations associated with lipid disorder and cancer, useful for prognosis, diagnosis and treatment of lipid disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 20 BP; 3 A; 6 C; 6 G; 5 T; 0 U; 0 Other;

Novel antisense compound targeted to nucleic acid molecule encoding clusterin, useful for treating animal having disease associated with clusterin such as hyperlipidemic disorder, cardiovascular disorder.

```
The invention comprises antisense oligonucleotides that are capable of inhibiting expression of the human clusterin gene. The antisense oligonucleotides of the invention are useful for inhibiting the expression of clusterin in cells. The antisense oligonucleotides are also useful for treating an animal with a disease or condition associated with clusterin (e.g. hypercholesterolaemia; cardiovascular disorders; hyperproliferative disorders; and hyperlipidemic disorders). The present DNA sequence represents a clusterin antisense oligonucleotide of the invention. NOTE: The present DNA sequence has a phosphorothicate backbone and also contains 2'-O-methoxyethyl wings
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a compound of 8-50 nucleobases in length targeted to a nucleic acid encoding protein phosphatase 1B (FTP1B), where the compound specifically hybridises with and inhibits the expression of FTP1B (e.g. an antisense oligonucleotide). Also included are (1) a compound of 8-50 nucleobases in length which specifically hybridises with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Compound for inhibiting the expression of protein phosphatase 1B (PTP1B) and for treating diabetes, cancer, or obesity, comprises an antisense oligonucleotide targeted to nucleic acid encoding PTP1B.
                                                                                                                                                                                                                                                                                                            Gaps

New isolated nucleic acid molecule encoding a soluble adenylyl cyclase for qualitatively or quantitatively diagnosing conditions arising from soluble adenylyl cyclase activation.

This polynucleotide sequence represents the RT-PCR primer 1 for amplification of soluble adenylyl cyclase (sAC) cDNA. The invention relates to isolated nucleic acid molecules encoding soluble adenylyl

Example 1; Page 53; 108pp; English.

catactule, Auton mediates cellular responses to nutritional conditions and extracellular signals in organisms from prokaryotes to higher eukaryotes.

CAMP has long been known to exert both stimulatory and inhibitory effects on cell growth and proliferation. The invention is used inhibitory effects on cell growth and proliferation. The invention is used for detect an increase or decrease in the level of sAC in a biological sample from a mammal suspected of suffering such a condition is used for diagnosing the likelihood or onset of, or for monitoring the course and severity of a pathological condition (such as cancer, infertility or diabetes)

cassociated with sAC activation, or deficiency of sAC activation. The isolated polynucleotides of the invention are useful for diagnosing a pathological condition, for monitoring blood gases, for qualitatively or quantitatively diagnosing conditions arising from sAC activation, to detect sAC specific cell lines and to detect sAC positive cells in a patient, in particular a human patient. The advantage of this invention is a new method of screening for a modulator of sAC-induced signalling permits rapid evaluation of a cellular response, and short-circuits cells in a continual assays by detecting individual response in a capture of sacration in pathological assays by detecting individual response in a capture of sacration in the consuming biological assays by detecting individual response. ö Antisense; human Integrin beta 4 binding protein; hIbeta4BP; cytostatic; cell proliferation; cancer; gene therapy; phosphorothioate backbone; ss. signals in sAC-induced signal transduction pathway. Signal transduction assays can be performed with very small amount of material. The polynucleotides and proteins of the invention have cytostatic, cyclase (sAC) proteins. Adenylyl cyclase (AC) is the effector molecule one of the most widely used signal transduction pathways. Its product, cyclic AMP (cAMP), is a nearly universally utilised second messenger Gaps ; 0 antidiabetic, ophthalmological and antiinfertility activities 0.4%; Score 15.2; DB 1; Length 20; 5.0%; Pred. The invention relates to an isolated or substantially pure Von Willebrand factor-cleaving protease (VWF-cp) polypeptide. VWF-cp is useful for purifying VWF which involves providing VWF-cp as a ligand, contacting a solution comprising vWF with the polypeptide ligand under conditions where vWF is bound to the ligand and recovering from the ligand purified VWF. VWF-cp is useful for producing anti-vWF cp polypeptide antibodies which involves immunising an animal with VWF-cp and isolating the anti-VWF cp polypeptide antibodies from the animal. VWF-cp is useful for producing a preparation of prophylaxis and therapy of thrombosis and thrombocytic purpura (TTP), thromboembolic disease such as thrombotic thrombocytopaenia or haemolytic-uraemic syndrome. VWF-cp can also be used for processing plasmatic or recombinantly produced VWF. The invention is useful for construction expression systems and generating transgenic animals which express the polypeptide in vivo. The present sequence is human VWF-cp
                                                                                                                                                                                                                                                                       Novel isolated or substantially purified Von Willebrand factor-cleaving protease, useful for producing preparation for therapy of thrombosis and thromboembolic disease such as thrombotic thrombocytic purpura.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  mouse; HYPLIP1; FCHL1; familial combined hyperlipidaemia; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense compounds targetted to a nucleic acid encoding human Integrin beta 4 binding protein (hibeta4BB), which specifically hybridises with the nucleic acid and inhibits its expression. The antisense compounds are useful to prevent or treat diseases associated with hibeta4BP expression, particularly conditions involving aberrant or deregulated cell proliferation (e.g. cancer). The hibeta4BP polynucleotide is used in gene therapy. The present sequence is an antisense oligonucleotide targetted to hibeta4BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antisense compound targeted to a region of a nucleic acid encoding human Integrin beta 4 binding protein and that inhibits expression of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; Von Willebrand factor-cleaving protease; vWF-cp; therapy; enzyme; transgenic animal; immunisation; thromboembolic disease; preeclampsia; thrombocitc thrombocytic purpura; TTP; Henoch-Schonlein purpura; thrombosis; neonatal thrombosytopaenia; haemolytic-uraemic syndrome; transgenic; anticoagulant; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human Von Willebrand factor-cleaving protease cloning PCR primer, 6561.

The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 CDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human FCHL1 coding sequences and PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Entomopoxyvirus spheroidin gene; EPV; active promoter; thymidine kinase; virus vector system; vaccinia; swine pox virus vector; ds.

New Entomopoxyvirus spheroidin gene sequences isolated from infected Amsacta moorei are useful in expression cassettes to regulate expression of heterologous DNA in virus vector systems.

The invention relates to a novel isolated Entomopoxyvirus (EPV) spheroidin gene polynucleotide which is either an active promoter or an active promoter plus a coding sequence, and is able to direct expression

Example 6; Col 27; 88pp; English.

               sequences of the EPV spheroidin and thymidine kinase genes are useful in expression cassettes to regulate expression of heterologous DNA in virus vector systems, for example in vaccinia and swine pox virus vectors. This polynucleotide sequence represents a nucleic acid relating to the novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleocide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and
of an operably linked heterologous gene in a host cell. The regulatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     χ;

The antisense oligonucleotides were designed to target different regions of the human and/or mouse C/EBP alpha RNA, and were analysed for their effect on C/EBP alpha mRNA levels by quantitative real-time PCR. The C/EBP family of proteins are a family of transcription factors which regulate the expression of a wide range of genes that control normal tissue development, cellular function, cellular

proliferation and functional differentiation. C/BBP beta (also known as C/BPB2, LAP, TCF5, CRP2, NFIL6, IL6DBP, NF-M, AGP/BBP and Apc/BBP)
Cytimarily regulates hormone responsiveness and oxidative stress responses and is a mediator of IL-6 (interleukin-6) signalling. C/BBP beta is thought to be involved in carbohydrate metabolism, immunity, the Thl response, female fertility and gluconeogenic pathways. C/BBP beta is expressed in the liver, lung, spleen, kidney, brain, and testis, with the highest expression found in the lung. It is also expressed at a higher level in malignant ovarian tissue compared with normal ovarian tissue, and its expression in pancreas is upregulated in response to chronically elevated levels of glucose, indicating that it is involved in the impairment of insulin secretion in type II diabetes. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with C/BBP beta expression, such as cancer (particularly ovarian cancer), tumour formation, diabetes (particularly type II diabetes), infection, or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method (M1) for designing capture oligonucleotide probes (II) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, K-ras, PCR primer; probe, capture probe, mutation detection; ligase detection reaction; LDR; p53; BRCA1; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forensic; environmental monitoring; food industry; feed industry; ss.

               selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the particular sites and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide probe sets occurred and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptide of interest, which comprises using a cost effective medium that does not contain serum or any functional (and/or recombinant) full-length protein. The medium comprises water, plant-derived peptone, osmolality regulator, buffer, energy source, amino acids, lipid source or precursor, source of iron, non-ferrous metal ions and one or more vitamins and cofactors. An example of a protein of interest is human erythropoietin (EPO). The method is useful for producing recombinant proteins of interest. The present sequence is an oligonucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, erythropoietin, cell culture process, vector; PCR; primer; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a method of recovering and purifying recombinant human erythropoietin (rhEpo) from a cell culture medium having host cells comprising removing host cells, cellular constituents and debris from the cell culture medium by performing a procedure comprising centrifugation followed by a depth filtration step and centrifugation. The method is useful for recovering and purifying rhEpo from a cell culture medium. The present sequence is an oligonucleotide shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      erythropoietin (rhEpo) from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                cells,

The novel compound specifically hybridizes with a nucleic acid molecule encoding the short heterodimer partner-1, and inhibits the expression of the nucleic acid molecule. The compound, and a composition comprising it are useful for treating a disease or condition associated with the short heterodimer partner-1, partneularly a condition involving abnormal lipid or cholesterol metabolism such as atherosclerosis or a cardiovascular disease. They are also useful in research and diagnostics for modulating the expression of short heterodimer partner-1. They can also be useful prophylactically in preventing or delaying infection, inflammation or tumour formation. This polynucleocide sequence represents a mouse antisense oligo relating to the heterodimer partner-1 of the

The invention relates to a new orally acceptable immunogenic composition comprising unpurified or partially purified recombinant HCV (Hog cholera virus), IBDV (Infectious Bursal Disease Virus), IBN (infectious bronchitis virus), ILTV or PRRSV (porcine reproductive and respiratory syndrome virus) immunogen expressed in a plant, where the immunogen is expressed in the plant at a level so that upon oral administration of the composition to an animal, an immunogenic response is observed. The composition is useful for producing an immunogenic response against HCV, IBDV, IBV, ILTV or PRRSV antigen. Sequences ABZ76423-28 represent primers, based on the ORPID encoding the polymerase protein, used for PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New orally acceptable immunogenic composition comprising unpurified or partially purified recombinant HCV, IBDV, IBV, ILTV or PRRSV immunogen expressed in a plant, useful for producing an immunogenic response

                                                                                                                                                                      New antisense compound, useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid
                                                                                                                                                                                                                                                    nucleobases in length targeted to a nucleic acid molecule encoding p38 mitogen-activated protein kinase (MAPK). The products of the invention have antiarthritic and antiinflammenty activity, can act as act as kinase inhibitors. The antisense compound is useful for preparing a composition for diagnosing, treating or preventing inflammatory diseases, e.g. rheumatoid arthritis or for use in antisense gene therapy. This sequence represents an antisense oligonucleotide used in a method to

The present invention describes a compound (C) 8-50 nucleobases in length targeted to a nucleic acid molecule encoding vascular endothelial growth actor teceptor.1 (VBGFR-1), where the compound inhibits the expression of VBGFR-1 and specifically hybridises with the nucleic acid encoding C VBGFR-1 or with an 8-nucleobase portion of an active site on the nucleic acid molecule encoding VBGFR-1. Also described: (1) a composition comprising (C) and acariter or diluent; (2) inhibiting the expression of VBGFR-1 in cells or tissues by contacting the cells or tissues with (C) so that the expression of VBGFR-1 is inhibited; and (3) treating an animal sharing a disease or condition associated with VBGFR-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, administering (C) to the animal so that the expression of VBGFR-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, cytostatic and antiinflammatory activities, and can be used in antisense expression of VBGFR-1 and for treating diseases or conditions associated with the expression of VBGFR-1 such as hyperproliferative disorders angiogenesis. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, continuous formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a human VBGFR-2 chimeric phosphorothioate, antisense oligonucleotide, which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /note= "This oligonucleotide has a phosphorothioate backbone and 2'-0-methoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 5 nucleotides in length. Also all

The present invention describes a compound (C) 8-50 mucleobases in length targeted to a nucleic acid molecule encoding vascular endothelial growth factor receptor-1 (VEGER-1), where the compound inhibits the expression of VEGER-1 and specifically hybridises with the nucleic acid encoding VEGER-1 and specifically hybridises with the nucleic acid encoding VEGER-1. Also described: (1) a composition comprising (C) and a carrier or diluent; (2) inhibiting the expression of VEGER-1 in cells or tissues by contacting the cells or tissues with (C) so that the expression of VEGER-1 is inhibited; and (3) treating an animal having a disease or condition associated with VEGER-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, administering (C) to the animal so that the expression of VEGER-1 is inhibited. (C) has antianglogenic, antirheumatic, antiarthritic, cytostatic and antiinflammatory activities, and can be used in antisense gene therapy. The antisense compounds are useful for modulating the expression of VEGER-1, such as hyperproliferative disorders (C) e.g. cancer), rheumatoid arthritis, or diseases or conditions involving angiogenesis. The antisense compounds are also useful for disquestics, therapeutics, prophylaxis, e.g. to prevent or delay infection, continualmation or tumour formation, as research reagents and kits, and in distinguishing between functions of various members of a biological pathway. The present sequence represents a human VEGER-2 chimeric formatices of phosphorothicate and tissues oligonucleotide, which is used in an example
                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotide targeted to a nucleic acid encoding vascular endothelial growth factor receptor-1, useful for diagnosing or treating cancer, rheumatoid arthritis, or diseases or conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Recombinant protein production, vector; host cell line; erythropoietin; EPO; human; selection agent; selectable marker; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0.4%; Score 15.2; DB 1; Length 20; 35.0%; Pred. method for determining the relative copy number of a group of target nucleic acid molecules present in a sample. The method comprises: (1) performing a first PCR in a PCR mixture; (2) performing a second PCR in a PCR mixture; (2) performing a second PCR in a PCR mixture; and (3) quantifying the number of copies of the second target nucleic acid product present in the sample containing the target a group of target nucleic acides in a sample; and (2) determining whether a subject is at risk of acquiring Alzheimer's disease. The method is useful for determining the relative copy number of a group of target nucleic acid molecules present in a sample for determining whether a subject is at risk of acquiring Alzheimer's disease. ACC99520 to ACC99730 represent PCR primer used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing polypeptide of interest by culturing hybridoma or transformed host cell which comprise a nucleotide sequence encoding polypeptide, in culture medium free from each of a plant-derived or animal-derived
               Determining the relative copy number of a group of target nucleic acid molecules present in a sample by performing a first or second PCR in a PCR mixture and quantifying the number of copies of the second target
                                                                                                                              The present invention describes a multiplex real-time quantitative PCR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant protein production; mammalian cell culture; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of producing a transformed evkaryotic host cell that expresses a recombinant polypeptide of interest comprising introducing into a eukaryotic host cell first and second polymuclectide vectors that are integrated into the genome of the host cell. Particular polypeptides of interest include human erythropoietin (EPO). The method is useful in producing host cells that express recombinant polypeptides, such as human erythropoietin, the polypeptides. The present sequence is an oligonucleotide used in the
                                                                                                                                                                                                                                          Producing a transformed eukaryotic host cell (e.g. Chinese hamster ovary cell) that expresses a recombinant polypeptide (e.g. erythropoietin) comprises introducing into the host cell a first and a second

interest, which involves culturing a hybridoma or transformed host cell interest, which involves culturing a hybridoma or transformed host cell in a culture medium for mammalian cell culture, where the medium comprises water, buffer, energy source, animo acids lipid source, or precursor, or iron source, animo acids lipid source, or iron source, animal acids lipid source, animal-derived peptone. An example protein which may be produced using the method is human erythropoietin (EPO). The method is useful for producing a polypeptide of interest chosen from human growth hormone, human monoclonal antibodies, preferably of subclasses 1gG, 1gM and 1gA, and monoclonal human/mouse chimeric antibodies, where the transformed host cell comprises at lass two polymucleotide vectors that encode different proteins of interest and where the different proteins are different parts of an antibody, particularly the light and heavy chains of an antibody. The present sequence is an oligonucleotide used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New primordial human neural crest stem cell having a pluripotent and self -renewing properties, useful for implantation in vivo for cell therapy treatment of human neurological disorders and diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, neural crest stem cell line, transplantation, cell therapy; neurological disease; HNC10 cell, neuroprotrotective; cerebroprotective;
                invention relates to a method of producing a polypeptide of 
nich involves culturing a hybridoma or transformed host cell
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention relates to a primordial human neural crest stem cell line suitable for on-demand implantation in vivo into a living host subject comprising a pluripotent and self-renewing neural crest stem cell of human origin. The cell line is useful in the cell therapy treatment of human neurological disorders and diseases. The present sequence is a PCR primer used to isolate human genes from the HNC10 cell line

caids span the variation position, a kit for the detection of the FCHLI caids span the variation position, a kit for the detection of the FCHLI course comprising, an isolated antibody, identifying susceptibility to a lipid disorder which comprises comparing the nucleotide sequence, where the difference between the suspected allele and the wild-type sequence identifies a sequence variation of FCHLI nucleotide sequence and a pharmaceutical composition. Also disclosed is a transgenic animal which carries an altered HYPLIP1 or FCHLI allele and a method for screening carries an altered HYPLIP1 or FCHLI allele and a method for screening carries an altered HYPLIP1 or FCHLI allele and a method for screening antibidies for inhibition or restoration of FCHLI, gene function as an antilipid disorder as a sequence with expression of FCHLI, for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype, hyperapobetalipoproteinaemia, hypertriglyceridaemia, low density lipoprotein (LDL) subclass B, familial dyslipidemic hypertension, synthesis and cancer. The sequence presented is a PCR primer which was used to amplify part of the mouse HYPLIP1 locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rat; soluble adenylyl cyclase; sAC; glucose regulation; insulin release; pancreatic islet cell; cAMP production; physiological bicarbonate level; reverse transcriptase; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid molecule encoding soluble adenylyl cyclase polypeptide, useful for regulating insulin secretion from pancreatic islet cells.

adenylyl cyclase. The soluble adenylyl cyclase (sAC) comprises a fully defined sequence (S1) of 1608 or 1610 amino acids as given in the specification. (I) is useful for encoding soluble adenylyl cyclase. SAC is useful for glucose regulation of insulin release from pancreatic islet cells, and for regulating cAMP production. SAC is also useful as a sensor lin its capacity as an enzyme to determine physiological bicarbonate levels. This sequence represents a reverse transcriptase PCR primer used to analyse the expression of soluble adenylyl cyclase (SAC)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human orthologue of Aristaless homeobox gene, ARX. ARX gene is associated with infantile spasms (IS), non-specific X-linked mental retardation, X-linked myoclonic epilepsy and Partington syndrome. ARX gene is useful for diagnosing ARX-related disorders e.g., mild mental retardation, infantile spasms or dystonia. The present sequence is a PCR primer used for amplifying human ARX gene 3'
                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes an isolated polypeptide (I) comprising a variant form of a mouse HYPLIPI polypeptide sequence (S1) or a human FCHLI.

Colypeptide sequence (S2), not given in the specification, where the variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (S1) or (S2). A composition comprising or least 65 % sequence identify to (S1) or (S2). A composition comprising (I) is useful for treating or preventing cancer associated with expression of FCHLI. FCHLI gene or HYPLIPI gene and its product are useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to inpid disorder and cancer. FCHLI gene or its fragments are useful in gene the treatment of lipid disorder or cancerous cells. The sequence to variation of FCHLI gene or HYPLIPI gene is also useful in the diagnosis and prognosis of predisposition to lipid disorder and cancer. Antisense polymucheotide sequences are useful in preventing or diminishing the expression of HYPLIPI or FCHLI locus. This sequence represents a primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises antisense oligonucleotides which are targeted to the human mdm2 gene. The antisense oligonucleotides of the invention are useful for reducing hyperproliferation of human cells. The antisense oligonucleotides are also useful for treating: hyperproliferative disorders (e.g. cancer), psoriasis, fibrosis, atherosclerosis, or restenosis. The antisense oligonucleotides are also useful for modulating apoptosis, and for increasing expression of p21. The present DNA sequence represents a human mdm2 gene antisense oligonucleotide of the invention. The present sequence contains 2'-methoxyethoxy-residues and has a

The invention relates to a compound targetted to a nucleic acid molecule encoding haematopoietic cell protein tyrosine kinase. The compound inhibits the expression of haematopoietic cell protein tyrosine kinase and it specifically hybridises with the nucleic acid molecule encoding the tyrosine kinase. The site on the nucleic acid molecule encoding the tyrosine kinase. The antisense compounds are useful for modulating the expression of an active antisense compounds are useful for modulating the expression of haematopoietic cell protein tyrosine kinase and treating diseases or conditions associated with the expression of the tyrosine kinase, such as the reprofilerative disorders (e.g. cancer), inflammation, diabetes or a viral infection. The antisense compounds are also useful for diagnostics, therapeutics, prophylaxis, e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in pathway. The present functions of various members of a biological pathway. The present sequence is human haematopoietic cell tyrosine kinase antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to antisense compounds, compositions and methods for modulating the expression of Sonic hedgehog (SHH). The composition comprises antisense compounds targetted to SHH. The antisense compound is used to inhibit the expression of SHH in cells or tissues and to treat an animal having a disease or condition associated with SHH, such as cancer, an autolimume disease or an inflammatory disorder. It is also useful in differential and/or combinatorial analyses to elucidate expression patterns of a portion or the entire complement of genes expressed within cells and tissues. The antisense compounds are useful in antisense gene therapy. The present sequence is an antisense oligonucleotide targetted to human SHH DNA. This sequence is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= a // Arag= Arage // Arag= a phosphorothioate // Anote= "This oligonucleotide has a phosphorothioate backbone and 2-"methyoxyethyl (2'-MOE) wings at the 5'
                                                                                                                                                                                                                                                                                                                                                                                         New compound for inhibiting Sonic hedgehog (SHH) expression in cells tissues and for treating an animal having a disease or condition associated with SHH, such as cancer, an autoimmune disease, or an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1202 fully defined sequences as given in specification, a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human can further the snP containing oligo. The isolated human can of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms one of the PCR primers used in the single nucleotide polymorphism one of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                        Novel polynucleotide useful for detecting single nucleotide polymorphisms

The present invention relates to antisense oligonucleotides (ADH63077-ADH63154) targeted to fibroblast growth factor (FGF) receptor 2 coding sequences (ADH63049 and ADH63056), which specifically hybridize with and inhibit FGF receptor 2 expression. The antisense oligonucleotides are useful for treating or preventing diseases or conditions associated with FGF receptor 2 in an animal, e.g. hyperproliferative disorders (particularly cancer of the colon, lung, breast or skin), or developmental disorders. The antisense compound may also be used in wound healing. The antisense compounds are useful for diagnostics, therapeutics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antiinflammatory steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchollation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
and 3' ends, which are 5 nucleotides in length. Also all
cytidine residues are 5-methylcytidine"
                                                                                                                                                                                                                                                                                               New antisense oligonucleotides for modulating expression of genes encoding fibroblast growth factor receptor 2, useful for treating hyperproliferative (e.g. cancer of the colon, lung, breast or skin) or developmental disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; antisense; lung dysfunction; nasal airway dysfunction;

intiation codon, coding region, 5' or 3' end genomic flanking regions, 6' incitions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention of the invention and antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antifilammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of profice and prophylacide of this patent is not represented in the printed of the file and prophylacide of the prophylacide of the printed of the form o

first active agent comprising an oligomeclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 6' or regions within 2.10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an enast airway dysfunction and a second active agent comprising an has antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, receptor, producing bronchodilation, increasing levels of demosine receptor, producing bronchodilation, increasing levels of the subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone

Claim 15; SEQ ID NO 763; 872pp; English.

first active agent comprising an oligonuclectide antisense to the intration codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-axon junctions, or regions within 2'-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive and cytostatic activity. The composition may have a preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or intinflammation, lung allergies, or a respiratory effect of an antiinflammation, lung allergies, or a respiratory disease or condition. Once the sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences The invention relates to a novel pharmaceutical composition, which has a

```
The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antialergic, antiasthmatic, hypotensive, tumnosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also contininflammatory steroid in a subject, for reducing levels of an antiinflammatory steroid in a subject, for reducing levels of adenosine or lung surfactant in a subject, for reducing levels of denosine receptor, producing bronchodilation, increasing levels of adenosine or lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(8) antisense to specific gene(8) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or . biquinone

Disclosure; SEQ ID NO 3166; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an entitiflammatory steroid in a subject, for reducing levels of denosine receptor, producing bronchodilation, increasing levels of ubiquinone or ung surfactant in a subject's tissue, or treating bronchocinstriction, lung surfactant in a subject's tissue, or treating bronchosisticition, lung antilammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed of processing in the printed of participal parts of this patent is not represented in the printed processing in the printed of parts in the printed parts at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   &&&&&&&&
                                                                                                                                                                                The invention relaters to methods for internitying regions on incoppasition arker protein in a pumman patient, especially for detecting or predicting metastasis. The methods involve determining whether a neoplastic growth marker protein is overexpressed, either by the use of an antibody opecific for the protein, or by the use of PCR or hybridisation to detect nucleic acids encoding the marker proteins. A set of neoplastic growth markers are disclosed (SAGE (serial analysis of gene expression) tags for these are given in ADA26759-ADA26796), with protein tyrosine phosphatase type IVA member 3 (also known as PRL-3) being a preferred neoplastic growth marker. The neoplastic growth markers are specifically expressed at a higher level in metastatic cancers, compared with advanced and early stage cancers and normal cells frow which the cancer is derived.

Overexpression of the neoplastic growth markers is taken as an indication of that the tissue has a propensity to metastasiss. The invention also encompasses methods for treating a patient with an advanced or metastatic cancers. The methods of the invention are useful for identifying regions of neoplastic growth, for detecting or predicting metastatic cancers. The invention is paricularly applicable to incorpance or metastatic cancers. The invention is paricularly applicable.

```
The invention relates to an antisense oligonucleotide 8-30 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding a p38 mitogen activated protein kinase (MAPK). Where the antisense compound inhibits the expression of the p38 MAPK. The antisense oligonucleotide is useful for inhibiting the expression of p38 MAPK. The actisense oligonucleotide is useful for inhibiting the expression of p38 MAPK in cells or tissues. It is also useful for treating an animal having a disease or condition associated with p38 MAPK, e.g. an inflammatory or an autoimmune disease (e.g. rheumatoid arthritis) or a heart disease. In addition, the compound is used for disanostics, prophylaxis, or as research respents a p38 MAPK
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense, bronchoconstriction, allergy, hyposecretion, pain, respiratory tract inflammation, adenosine sensitivity, lung, cancer; surfactant depletion, antiallergic, antiinflammatory; antiasthmatic, analgesic, hypotensive, immunosuppressive, cytostatic, cystic fibrosis, beta-adrenergic agonist; respiratory disease, pulmonary vasoconstriction, respiratory distress syndrome, allergic rhinitis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotides for modulating p38 mitogen activated protein kinase (MAPK) expression, useful for diagnosing, preventing or treating diseases associated with p38 MAPK, e.g. inflammation or heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating comprising oligonuclectides, effective for alleviating controlled to respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The colligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mann. CC The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention as antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mann or comprises of composition and/or surfactant hypoproduction are associated inflammation, allergies and/or bronchocomstriction and/or lung allergies, asthma, impeded respiratory disease, pulmonary compliances, pain, cystic fibrosis, allergic rhinitis, pulmonary crannerlant, melloctic behavior the production are associated transcribion, emphysema, chance in the degradation of the carget pulmonary comprises of pain, cystic fibrosis, allergic rhinitis, pulmonary therefore on a pulmonary disease, pulmonary diseases, pulmonary comprises.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, prevent any unwanted effects due to it

WPI; 2003-093058/08.

ဌ Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 363; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating to comprising oligonucleotides, effective for alleviating to comprising oligonucleotides, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, contract depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regularing expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises. (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antianflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or traating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to inflammation, allergies and/or bronchoonstriction and/or lung inflammation, allergies and/or bronchoonstriction and/or bronchoonstriction and or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, the reduced adenosine content of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into preduce that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to it.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antisthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory

hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it.
                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation (a) or (a) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c)
distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   t

analgesic, hypotensive, immunosuppressive and cytostatic activity, is beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it

ţ Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating conditions.

Composition also deenosine sensitivity, levels of adenosine (A) or (A) receptors, reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, configuration or cancer and carbon a sene encoding or regulating expression of a target polypeptide associated with lung airway or lung dystunction or cancer and can be anti-sense to the corresponding mRNA.

Composition of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung constructions for adding a carrier and for use of the kit. The composition of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antialflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostratic activity, is a composition composition composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition composition composition and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory chitammation, allergies, asthma, impeded respiration, respiratory bulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cystic fibrosis, allergies and cystic fibros lung, brain, heart, kidney, etc, tissue environment and thereby, to Claim 15; SEQ ID NO 763; 763pp; English. prevent any unwanted effects due to it

                                                                                                                                                                                                                 유
                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to method of illumination and a biochip illumination apparatus that has a respective divergent diffuser proximate to each line of optical fibre faces for coupling and diffusing laser tight evently through the opposing sides of the glass substrate to illuminate the bioarray carried by the glass substrate. The illumination source includes a low power non-collimated laser emitting diode (LED). The divergent diffuser is made of silicon. The apparatus is useful for Dioarray illumination in a biochip reader. The invention provides a superior signal to noise ratio as compared with conventional illumination byochip manufacturing.
                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                          This invention describes a novel human ovarian cyst marker containing the RET proto-oncogene. The RET gene can be used in manufacturing a pharmaceutical for treating an ovarian cyst or for treating a tumour which also comprises an anticancer compound chosen from a taxol, a cisplatin, an adriamycin, an epirubicin, a cyclophosphamide and a anticancer activity and can be used in gene therapy. ADF42867-ADF42884 represent PCR primers used to amplify the human RET proto-oncogene described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Illumination system; biochip illumination; divergent diffuser; optical fibre; laser light; glass substrate; bioarray; laser light biochip reader; biochip manufacturing; probe;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Biochip illumination apparatus includes respective divergent diffuser proximate to each line of optical fiber faces for coupling and diffusing laser light evenly through opposing sides of glass substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       illumination apparatus that has a respective divergent diffuser proximate to each line of optical fibre faces for coupling and diffusing laser light evenly through the opposing sides of the glass substrate to illuminate the bioarray carried by the glass substrate. The illumination source includes a low power non-collimated laser emitting diode (LED). The divergent diffuser is made of silcon. The apparatus is useful for bioarray illumination in a biochip reader. The invention provides a superior signal to noise ratio as compared with conventional illumination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  systems. The present sequence represents an oligonucleotide probe used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biochip illumination apparatus includes respective divergent diffuser proximate to each line of optical fiber faces for coupling and diffusing laser light evenly through opposing sides of glass substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               111umination system; biochip illumination; divergent diffuser;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a compound targeted to a nucleic acid molecule encoding Notchl and which inhibits the expression of Notchl. The compound, composition and methods are useful for treating a disease or condition associated with Notchl, such as an autoimmune disorder, aberrant apoptosis or a hyperproliferative disorder, e.g. cancer. They are also useful in research and diagnostics for modulating the expression of Notchl. The present sequence represents a human Notchl antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compounds, particularly antisense oligonucleotides targeted to a nucleic acid encoding Notch1, useful for treating an autoimmune disease, aberrant apoptosis or cancer.

                                                                                                                                                                               acid molecule encoding human apolipoprotein B (ApoB) which specifically hybridises with and inhibits the expression of human apolipoprotein B. The compound of the invention demonstrates antiarteriosclerotic, cardiant, antidiabetic and anorectic activities and may be useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidaemia or cardiovascular disease. Furthermore, the compound has gene therapy applications. The current sequence is that of the 2'-O-methoxyebthyl (2'-MOE) gapmer antisense oligo of the invention which has 2'-MOE 'wings', a phosphorothicate backbone throughout and in which all cytidine residues
                                                                                                                                                       The invention relates to a novel antisense compound targeted to a nucleic
New antisense compound, useful for preparing a composition for treating abnormal lipid or cholesterol metabolism, atherosclerosis, diabetes Type 2, obesity, hyperlipidemia or cardiovascular disease.

The present sequence is that of a PCR primer for keratinocyte growth factor receptor (KGFR). RT-PCR was used to examine gene transcripts of importance to thymus organogenesis in marine thymic epithelial cells (TEC) expressing the cell surface glycoprotein MTS24. Transcripts for KGFR were found in both MTS24+ and MTS24- TECs. The present invention provides progenitor TECs which give rise to the complete thymus confirmment including both cortical and medullary epithelial lineages. These progenitor cells are identified by cell surface expression of MTS24. The cells can be used to prevent or treat diseases which can be alleviated by increasing the number of T cells and/or altering the T cell population of a subject. New thymic tissue derived from MTS24+ TECs is able to uptake appropriate T cell precursors such as the marrow cells from the ablood and convert them in the new thymic tissue to both new T cells and dendritic cells. MTS24+ TECs can be used
                                                New isolated MTS24 thymic epithelial progenitor cell, useful for treating cancer, allergy, autoimmune disease, produces a MTS24 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        to induce tolerance in a subject to a graft from a mismatched donor, to prevent or treat an autoimmune disease, to enhance an immune response to an antigen (especially to treat HIV infection following HAART treatment), to treat an allergy, and to prevent or treat cancer (e.g. following chemotherapy, radiation therapy or bone marrow transplantation). The MTS24 TRCS may be genetically modified e.g. to express a transgene encoding a polypeptide, double-stranded RNA, catalytic nucleic acid or antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 15.2; DB 1; Length 20;

This invention describes novel oligonuclectides or polynuclectide constructs which are used in pharmaceutical or diagnostic compositions.

The oligonuclectides are used for identifying modulators of pain, based on the ability of labelled oligonuclectides or polynuclectide constructs to bind to an RNA. The oliginuclectides can also be used to diagnose disease associated with altered expression of genes of the PIM Kinase family by measuring binding. The oligonuclectides have at least one modified ribose, phosphodiester and/or base component. Particularly many, of the nuclectide is a phosphorothicate. The polynuclectide construct comprises a ribozyme, DNA enzyme, vector (particularly for expression) or peptide nucleic acid, most preferably a hammerhead ribozyme or Type 8-17 DNA crazyme. It may be attached to a carrier (preferably the proteins tet, transportin or ferritin) and/or encapsulated in a liposome. The products of the invention have analgesic, uropathic, antipruritic, cytostatic, antinfammarcory and antiasthmatic activity and can be used for antisense and catalytic inhibition of FIM kinases and for antisense gene therapy. The oligonuclectides are useful for treating (i) pain, especially chronic, hear-induced or inflammatory pain, or tactile allodynia and (ii) chronic, hear-induced or inflammatory pain, or tactile allodynia and contact and catalytic inhibition of plan kinases and contactile allodynia and contactile allodynia and contactile and contactile allodynia and contactile and contactil ö chronic, heat-induced or inflammatory pain, or tactile allodynia and (ii) urinary incontinence, neurogenic bladder symptoms, pruritus, tumours and inflammation, especially PIMI-kinase associated inflammation such as asthma, or generally any PIMI-related disease symptoms. They can also be used to screen for analgesic agents and for diagnosis of diseases associated with expression of PIM family genes. ADI26552-ADI26627 represent antisense oligonucleotides described in the disclosure of the against PIM1 kinase, useful for treating, e, tumors and inflammation, by gene Gaps ö Score 15.2; DB 1; Length 20; Pred. required for determination of at least one antiapoptotic member of the
Bell2 family and at least one member of the Raf family. The invention
involves a transgenic non-human mammal, especially a rodent, whose cells,
in a specific tissue, constitutively express Bell2 and Raf family
constitutively and a method of screening for potential anticancer agents.
The agents are detection reagents specific for mRNA or protein of the Bell
constitutively and a method of screening for potential anticancer agents.
The agents are detection reagents specific for mRNA or protein of the Bell
camplification. Preferred agents for detecting proteins are antibodies.
Specified antiapoptotic agents are Bell2, Bell-W, Bfl-1, Brag-1,
Mcl-1 or Al, and specified Raf members are C. B. or A.Raf, all
optionally mutated. The transgenic animals contain genes for Bell2 and
Raf under control of constitutive promoters, e.g. the SP-C promoter for
Raf under control of constitutive promoters, e.g. the SP-C promoter for
Raf under control of constitutive promoters, e.g. the SP-C promoter for
Raf under control of constitutive promoters, e.g. the SP-C promoter for
Raf under control of constitutive promoters, e.g. the SP-C promoter for
Raf under control of constitutive promoters, e.g. the SP-C promoter for
The products of the invention have cytostatic activity. The system is
used (i) to diagnose cancer, or the risk of developing it, in humans or
animals, or (ii) to screen for substances that, in cells that express
both Bell-2 members and Raf proteins, reduce expression or function of Bell
cancers. The method provides an early indication of the risk of
developing cancer. This sequence represents a PCR primer used to make the
cancers the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       methoxyethyl nucleotides. All cytidine methylcytidine."
                             Test system for detecting Bcl-2 and Raf family proteins, useful for diagnosis of cancer, or risk, and in screening for anticancer agents, also transgenic animals and cells for the test.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This invention relates to novel compositions and methods for modulating the expression of PTP1B (also known as protein phosphatase 1B and PTPN1). Specifically, it refers to antisense compounds that can target and hybridise with a nucleic acid molecule encoding PTP1B, as well as splice variants thereof and inhibit expression accordingly. PTP1B is a tyrosine phosphatase that plays an essential regulatory role in signalling mediated by the insulin receptor and as such is useful for treating diseases such as type 2 diabetes and obesity. Furthermore, PTP1B can suppress transformation of oncogenic genes, such that compositions of this invention can also be used to treat hyperproliferative conditions including cancer. Accordingly, these compounds can be described as having cytostatic, antidiabetic and anorectic activities. This oligonucleotide sequence is an antisense DNA oligo that targets human PTP1B DNA, and which has a phosphorothicate backbone and 2'-O-methoxyethyl wings, used in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention relates to a novel flower-bud formation suppressor gene. The invention is useful for regulating the time to flowering of a plant, conferring an early flowering property on a plant, or producing an early flowering plant, e.g. a perennial fruit tree. The present sequence is MÖTFL (Malus x domestica TERNINAL FLOWER) gene amplifying RACE (rapid amplification of cDNA ends) PCR primer.
                                                                                                                                                                                                                                                                 New flower-bud formation suppressor nucleic acid, useful for regulating the time to flowering of a plant, conferring an early flowering property on a plant, or producing an early flowering plant, e.g. a perennial fruit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New compound, particularly an antisense oligonucleotide targeted to a nucleic acid encoding KIAA1531, useful for treating cancer, chronic inflammation or conditions involving hyperactivation of angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            human; KIAA1531; hyperproliferative disorder; cancer; angiogenesis hyperactivation; chronic inflammation; ss; antisense.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes an antisense compound, having a sequence comprising 8-50 bp targeted to a nucleic acid encoding Notchl. The compound specifically hybridises with the nucleic acid encoding Notchl and inhibits its expression. The compound has cytostatic and immunosuppressive properties and is suitable for used in gene therapy. The compound is useful for preparing a composition for treating a disease or condition associated with Notchl e.g., developmental, autoimmune or hyperproliferative disorders, such as cancer. This sequence represents an antisense oligonucleotide specific to human Notchl.
                                                                                                                                                                        /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                    ö
                      The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding KIAA1531 and inhibits the expression of KIAA1531. The compound, composition and methods are useful for treating a disease or condition associated with KIAA1531, such as a hyperproliferative disorder, e.g. cancer, a disease or condition involving hyperactivation of angiogenesis, or chronic inflammation. They are also useful in research and diagnostics for modulating the expression of KIAA1531. The present sequence represents a human KIAA1531 antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   useful for treating a disease or condition associated with KIAA1531, such as a hyperproliferative disorder, e.g. cancer, a disease or condition involving hyperactivation of angiogenesis, or chronic inflammation. They are also useful in research and diagnostics for modulating the expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to and which specifically hybridises with a nucleic acid molecule encoding KIAA1531 and inhibits the expression of KIAA1531. The compound, composition and methods are
                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New compound, particularly an antisense oligonuclectide targeted to a nucleic acid encoding KIRA1531, useful for treating cancer, chronic inflammation or conditions involving hyperactivation of angiogenesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRH1) and splice variants thereof. Specifically, it refers to compositions 8-30 nucleobases in length that target a portion of an active site on the nucleic acid molecule encoding LRH1 (also known as NR5A2). LRH1 is a monomeric orphan nuclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside linkage, a phosphorothioate linkage; at least one modified sugar moiety,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                             phosphorothicate; 2' MOE; breast cancer; dyslipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; gall stone; triglyceridaemia; obesity; hepatitis; hepatocellular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiinflammatory; virucidal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                methoxyethyl (2' MOE) nucleotides. All ses are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /mod_base= OTHER //mote= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                    Antisense DNA oligo used to modulate human LRH1 expression SeqID 1221.
                                                                                                                                                                                                                                                                                                                                                         human; 88; liver related homologue-1; LRH1; NR5A2; antisense;

                                                                                                                                                                                                                                                                                          The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. a 2'-O-methoxyethyl (2' MOE) and at least one modified mucleobase, a 5-methylcytidine. These antisense compounds are useful for treating or diagnoshing a disease associated with LRHI, such as breast cancer, dyslipidaemia, atherosclerosis, low HDE (high density lipoprotein), high LDE (low density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B virus-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cytostatic, antilipaemic, antiarteriosclerotic, anorectic, hepatotropic, litholytic, antilnflammatory and virucidal activities. This oligouscleotide sequence is an antisense DNA oligo used to modulate the expression of the human LRHI protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human; ss; liver related homologue-1; LRH1; NR5A2; antisense; bobsphorothicate; 2' MDS; breast cancer; dyelipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hippercholesterolaemia; gall scone; triglyceridaemia; obesity; hepatitis; hepatcellular carcinoma; aromatase; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatcorropic; litholytic; antiliflammatory; virucidal.

This invention relates to novel antisense compounds useful for modulating the expression of liver related homologue-1 (LRHI) and splice variants thereof. Specifically, it refers to compositions 8-10 nucleobases in clength that target a portion of an active site on the nucleic acid molecule encoding LRHI (also known as NR5A2). LRHI is a monomeric orphan cuclear receptor protein that functions as a tissue specific or transcription factor. The present invention describes antisense or inkage, a phosphorothoate linkage, at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a 2'-0-methoxyethyl (2' MOE) and at least one modified sugar moiety, a disanse associated with LRHI, such as beast cancer, dyalipidaemia, atherosclerosis, low HDL (high density lipoprotein), high complement, observed acute or chronic chaptitis, as well as hepaticellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit containfilammatory and virucidal activities. This oligonucleotide sequence is an antisense DNA oligo used to modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;
                                        New antisense oligonucleotides targeted to a nucleic acid encoding liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human; ss; liver related homologue-1; LRH1; NR5A2; antisense; hospbrorchhiotete, 2' MOSE; breast cancer; dyalipidaemia; atherosclerosis; low HDL; high density lipoprotein; high LDL; hypercholesterolaemia; gall stone; triglyceridaemia; obesity; hepatitis; antilipaemic; arctinoma; aromatese; cytostatic; antilipaemic; antiarteriosclerotic; anorectic; hepatotropic; litholytic; antiinflammatory; virucidal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /note= "OTHER= 2' methoxyethyl (2' MOE) nucleotides. All cytidine nucleobases are 5-methylcytidine."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense DNA oligo used to modulate human LRH1 expression SeqID 1052
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                            related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.

Specifically, it refers to compositions 8-30 nucleobases in clearly that target a portion of an active site on the nucleac acid molecule encoding LRH1 (also known as NESA2). LRH1 is a monomeric orphan conclear receptor protein that functions as a tissue specific transcription factor. The present invention describes antisense oligonucleotides that comprise at least one modified internucleoside oligonucleotides that comprise at least one modified internucleoside at linkage, a phosphorothicate linkage; at least one modified sugar moiety, and agnosing a disease associated with LRH1, such as breast cancer, disgnosing a disease associated with LRH1, such as breast cancer, disgnosing a disease associated with LRH1, such as breast cancer, disgnosing a disease associated with LRH1, such as breast cancer, thigh density lipoprotein), hypercholesterolaemia, gall stones, triglyceridaemia, obesity, hepatitis B vius-mediated acute or chronic hepatitis, as well as hepatocellular carcinoma or a condition associated with aromatase activity. Accordingly, these compositions exhibit cyclostatic, antilibermic, antil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to novel antisense compounds useful for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides targeted to a nucleic acid encoding liver related homologue-1 (LRH1), useful for treating breast cancer, dyslipidemia, atherosclerosis, hypercholesterolemia, or hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antilipaemic, Cardiovascular; Analgesic; Antianginal; Antisense therapy; Human; Endothelial Lipase; dyslipidaemia; high density lipoprotein; HDL; cardiovascular disorder; metabolic syndrome X; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antisense oligonucleotide for modulating endothelial lipase expression, for diagnosing, preventing or treating e.g. dyslipidemia, low high density lipoprotein or cardiovascular disorders.
                                                                                 /*tag= a //*tag= //*tag= a //*tag= //*tag= //*tag= //*nd base= OTHER //*note= This oligonucleotide has a phosphorothioate backben and 2-'methyoxyethyl (2'-MOE) wings at the 5' and 3' ends, which are 4 nucleotides in length. Also all and 3' ends, which are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; VEGF co-regulated chemokine-1; VCC-1; vascular endothelial growth factor; ss; antisense compound; vascular endothelial growth factor; ss; antisense compound; phosphorothicate linkage; 2'-0-methoxyethy! sugar moiety; beathylcytosine; antisense oligonucleotide; diabetes; immunological disorder; cardiovascular disorder; neurological disorder; ischaemia; reperfusion injury; cancer; angiogenic disorder; haemangioma; tumour angiogenesis; rheumatoid arthritis; atherosclerosis; psoriasis; fibrosis; myocardial infarction; wound healing; bone fracture; cartilage damage; tissue regeneration; organ regeneration; periodontal disease; gut regeneration; atrial fibrillation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to antisense oligonucleotides (ADJ21603-ADJ25510) targeted to human Endothelial Lipase (EL) coding sequence (ADJ25517), where the antisense oligonucleotide specifically hybridises with and inhibits the expression of EL. The antisense oligonucleotides are useful for modulating the expression of endothelial lipase in cells or tissues to treat diseases associated with EL expression, such as dyslipidaemia, low high density lipoprotein (HDL), cardiovascular disorder or metabolic syndrome X. In addition, the oligonucleotides are used for diagnostics, prophylaxis, or as research reagents or kits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human VEGF co-regulated chemokine-1' DNA antisense oligonucleotide #406.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
        The invention relates to an antisense compound targeted to a nucleic acid molecule encoding human vascular endothelial growth factor (VEGF) co-
cegulated chemokine-1 (VCC-1), and which specifically hybridises with and inhibits the expression of VCC-1. The invention also relates to a composition comprising the antisense compound, a method of inhibiting the expression of VCC-1. The invention also contacting the calls or tissues compound and a method of treating a human cartisgues with the antisense compound and a method of treating a human cartisgues with the antisense compound to an animal to inhibit expression of VCC-1. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one modified sugar moiety, preferably a 2'-0-comprises at least one condition. The antisense oligonucleotide preferably is a chimeric oligonucleotide. The antisense compound is useful for treating a disease or condition associated with VCC-1, such as diabetes, an immunological disorder, a cardiovascular disorder, a neurological disorder, a cardiovascular disorder, a neurological disorder, a perfusion injury, cancer or an angiogenic attended and sorder, e-g. haemangioma, tumour angiogenesis, rheumangiod arthritis, attended of bone fractures and cartilage damage, for regeneration of tissues or organs, for treating periodonal diseases, for gut protection or regeneration, for treatment of lung or liver fibrosis an antisense or organs, for treatment of lung or liver fibrosis an antisense management of artial fibrillation. This sequence regeneration for the antise of the condition of the conditio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  oligonucleotide targeted to DNA encoding the human VCC-1 polypeptide of

                                                                         comprising 8-30 bp targeted to a nucleic acid encoding endochelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of

The invention describes a new antisense compound, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding endothelial specific molecule-1 (ESM-1), that specifically hybridises with the nucleic acid ESM-1 and inhibits its expression. Also described are: a composition; inhibiting the expression of ESM-1 in cells or tissues; and treating an animal having a disease or condition associated with ESM-1. The compound is useful for preparing a composition for treating diabetes, cancer, ischaemia or reperfusion injury, or angiogenic, immunological, cardiovascular or neurological disorder. This sequence represents an antisense oligonucleotide that can be used to modulate expression of
